

# High resolution automated substrate mapping

*The more the better or old-fashioned VT mapping?*

Antonio Frontera, MD  
San Raffaele Hospital, Milan, Italy

Consultant for Boston Scientific, Abbott

## 1 To distinguish **scar** from **healthy** tissue

Not an easy task.

## 2 To define **LPs** / **LAVA**

Are always related to the VT circuit?

## 3 To orientate your self

*In presence of multiple VTs and/or arrhythmic storm*

## 4 Improve **long-term** VT ablation *outcomes*

*As literature demonstrates*

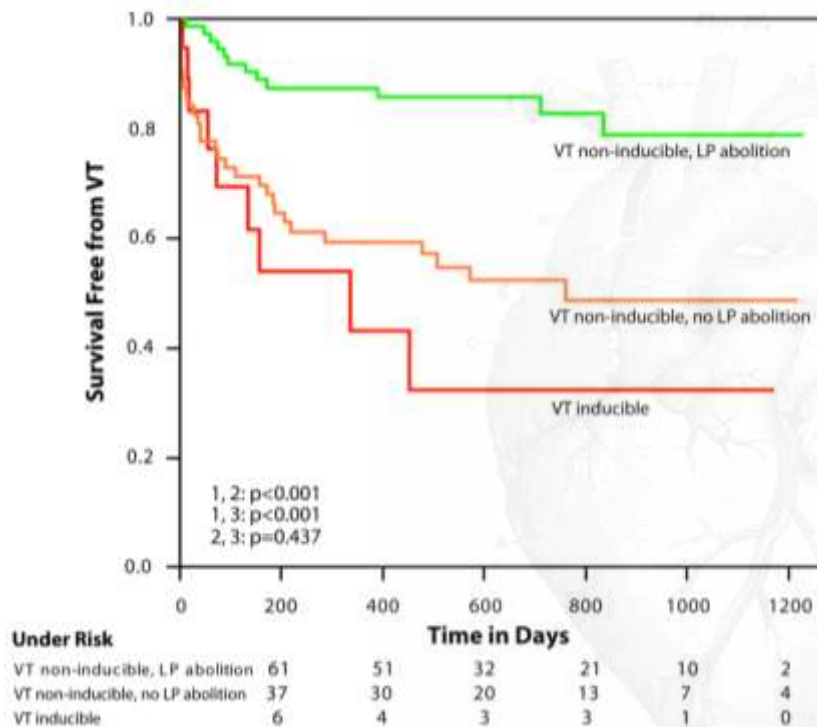

### Study population

155 patients (post-MI VT)

Mean EF:  $31 \pm 3,3\%$

LPs in 103 pts (65%)

LPs successful ablation:  
79/103 (76%)

VT recurrence rate in the overall population

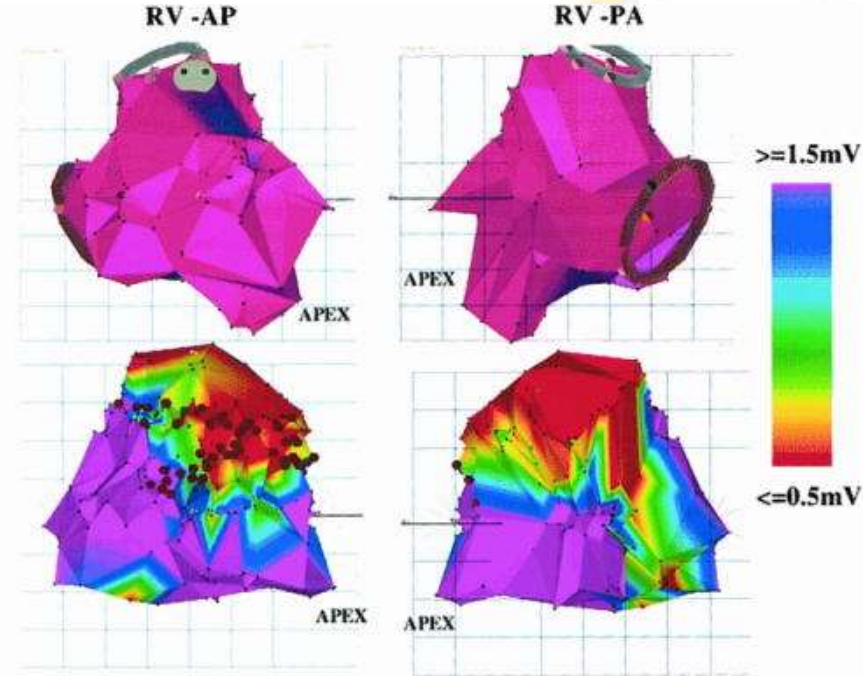

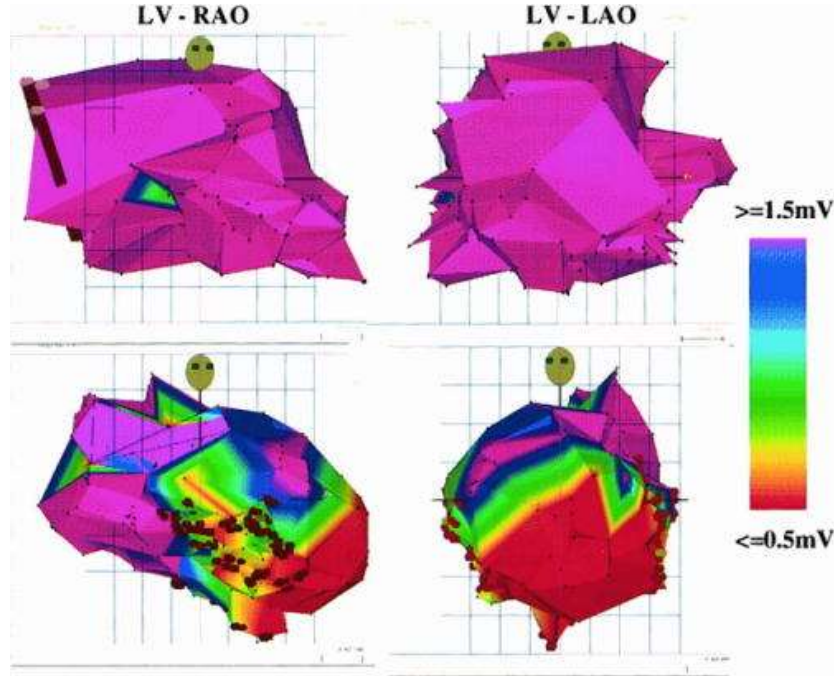

*Silbebauer et al.*

Circulation EP 2014 Jun;7(3):424-35.

- 1** To distinguish **scar** from **healthy** tissue  
Not an easy task.

## Old Fashioned Substrate Mapping

SR mapping in 6 healthy controls:

- Normal endocardium was defined by a bipolar voltage amplitude  $>1.5\text{ mV}$
- Dense scar was defined by  $<0.5\text{ mV}$

# Endocardial and Epicardial Radiofrequency Ablation of Ventricular Tachycardia Associated With Dilated Cardiomyopathy The Importance of Low-Voltage Scars

*RF ablation lesions were applied to the **target area** until the pacing threshold exceeded 10 mA at 2 ms pulse width.*

***Target areas** defined by means of*

- *Concealed entrainment in tolerated VTs*
- *Pace-mapping manoeuvres in unmappable VTs*

## High resolution substrate mapping

The (HD) definition of scar , «borderzone» is critically **dependent** upon:

- *Activation wavefront*
- *Electrode size*
- *Inter-electrode distance*
- *Contact vs non contact*

## The Orion tool

- *Electrode size*

1 mm

1.7 mm

*Inter electrode distance*

# The HD Grid

## The Activation Front

---

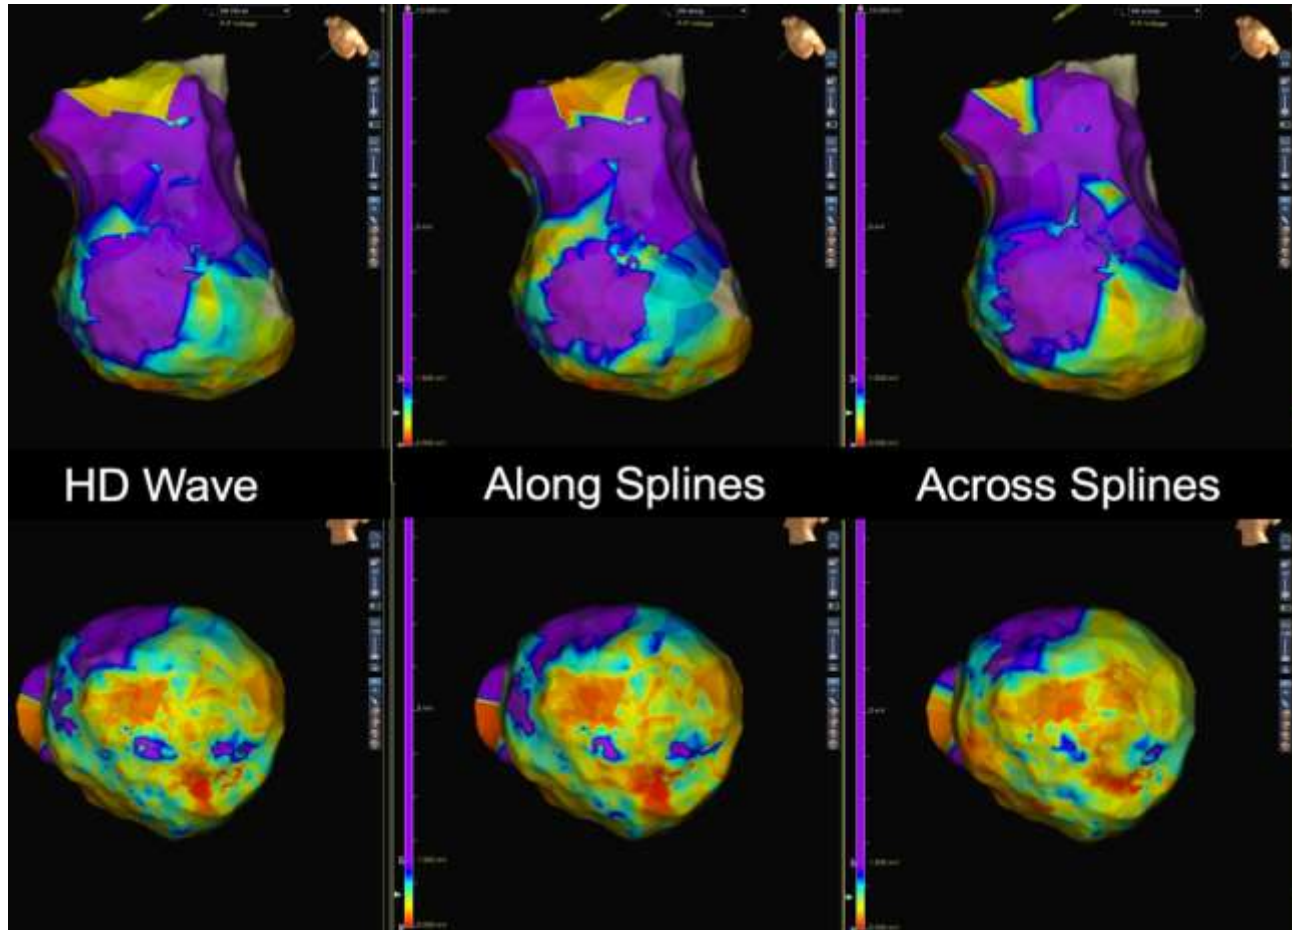

# The Activation Front

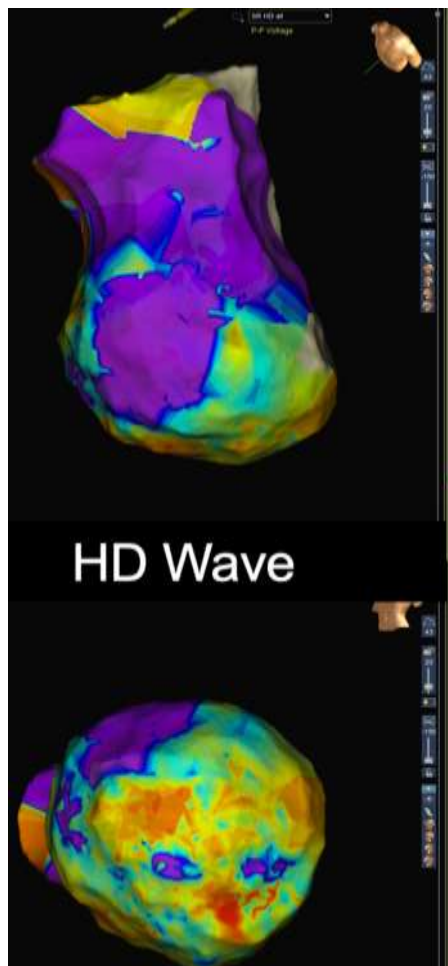

---

# The Activation Front

## The inter-electrode distance

*The shorter distance*

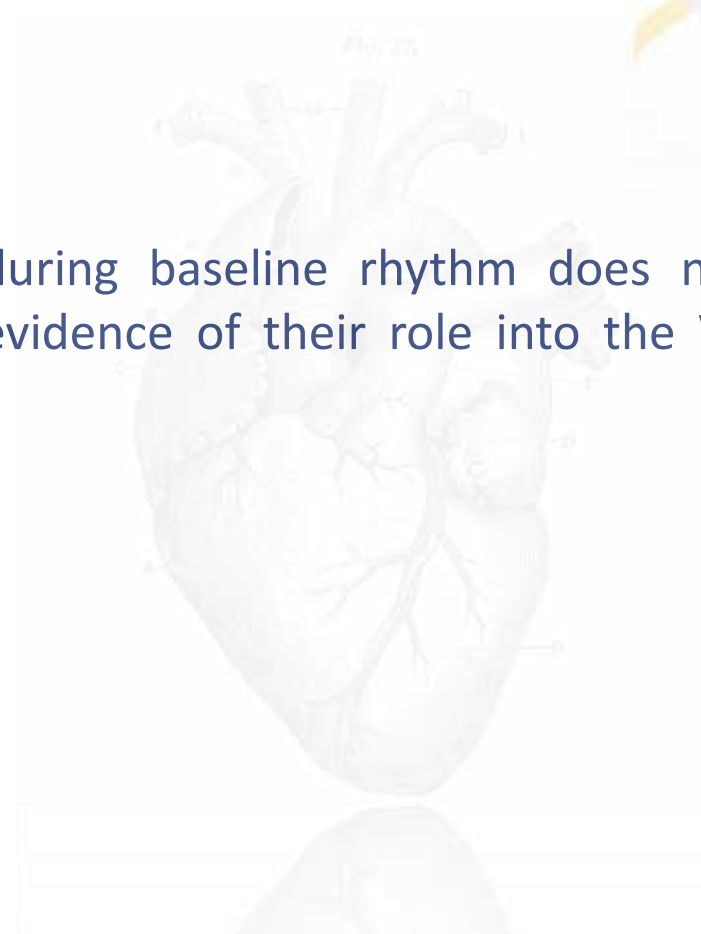

*The best resolution*

*The best characterization*

- 2** EGM characterization during baseline rhythm does not provide a trustworthy evidence of their role into the VT mechanism

# LAVA and LPs

## LP = Sometimes bystanders

# LAVA vs LP

## Re Map

# 2 No late activity could be recorded.

*Sometimes happens!*

## Clinical case

- Male, 75 yo
- Ischemic heart disease (previous inferior MI + CABG)
- Severe LV dysfunction (EF: 27%)
- Previous CRT-D implantation.
- History of post-MI VT refractory to antiarrhythmic therapy. After a first procedure of VT RFCA (2012) the patient was free of VT recurrences for 5 years
- In the last 8 months the patient had 3 episodes of electrical storm on fast VTs (CL: 280 ms).
- Referred for a second catheter ablation attempt.

VT induction

## Clinical case

... if you're going through hell  
.. keep going ..

*The future in substrate mapping*

## The future in substrate analysis

*Electroanatomical map*

*Circuit Depiction*

*Automatized analysis*

**Figure 1** MATLAB automatized analysis of slow conduction. The MATLAB script identifies and analyzes areas of decreased velocity conduction. Electrophysiological characterization of the localized reentrant circuit is shown on the **right**.

# The future in substrate analysis

## Conclusions

---

- (HD) **substrate mapping** represents a **crucial step** in the context of VT ablation.
- **Multi polar / Multi electrodes** catheters are the keys in the scenario of VT mapping strategies. *More informations = More knowledge*
- Mapping technologies have improved a lot BUT **few advancements** have been made for **softwares** and **algorithms**.
- New scenarios will be the on-line **analysis** of **conduction velocities** and vector orientations of wavefronts
